

A frontier liquidity gradient that is really an asset-class gradient

NEPSE publishes one daily file for every listed instrument and no instrument-type field. Sorting it by trading intensity yields a strong, clean, spurious gradient: the thin end is debentures, closed-end funds and restricted promoter shares. Within ordinary equity the gradient is absent.

A. The estimator's failure rate

B. Rogers–Satchell against its own target

C. What is actually in each quintile
